Calibration Comparison: 2024 vs. 2026

```
Warning: package 'cowplot' was built under R version 4.3.3
```

Overview

This report compares longitudinal calibration behavior between the 2024 and 2026 calibration datasets.

The analysis reproduces the drift analysis originally developed for the 2024 calibration data. For each anchor, calibration is compared with its calibration on the first day of the observation period.

Two measures of drift are examined:

1. **Instantaneous drift:** the absolute proportional difference between an anchor's current calibration and its calibration on Day 0.
2. **Maximum drift:** the largest instantaneous drift observed up to each point in time.

The analysis also examines the number of anchors that exceed 1%, 2%, 5%, 10%, and 20% deviation thresholds.

For the 2026 data, calendar dates are preserved throughout the analysis. Thus, the `days` variable represents actual elapsed calendar days rather than the number of calibration files retained after missing days were removed.

1. Load 2024 Data

The 2024 calibration data are read from individual CSV files. Each filename contains the calibration date, which is retained as the observation date.

```
# A tibble: 6 x 3
  date       id    calibration
  <date>     <chr>       <dbl>
1 2024-10-21 7236       73452.
2 2024-10-21 6232       80942.
3 2024-10-21 6841       69560.
4 2024-10-21 6660       72808.
5 2024-10-21 6368       68017.
6 2024-10-21 6835       76021.
```

1.1 Calculate Calendar Days for 2024

The first calibration date is treated as Day 0.

Check the date range:

```
  first_date  last_date calendar_days anchors
1 2024-10-21 2024-11-18            28     684
```

2. Load 2026 Data

The 2026 data require the same cleaning procedure used in the primary calibration analysis.

The calibration value is calculated as:

[y = 100m + b]

where (m) is the slope and (b) is the intercept.

2.1 Locate the 2026 Calibration Files

```
                        file       date
1 calibration_2026-01-16.csv 2026-01-16
2 calibration_2026-01-17.csv 2026-01-17
3 calibration_2026-01-18.csv 2026-01-18
4 calibration_2026-01-19.csv 2026-01-19
5 calibration_2026-01-20.csv 2026-01-20
6 calibration_2026-01-21.csv 2026-01-21
```

2.2 Remove Files with Insufficient Observations

Calibration files containing fewer than 500 observations are excluded.

The corresponding dates are removed at the same time so that the data and dates remain aligned.

```
                        file       date
1 calibration_2026-01-23.csv 2026-01-23
2 calibration_2026-01-25.csv 2026-01-25
3 calibration_2026-01-26.csv 2026-01-26
4 calibration_2026-01-28.csv 2026-01-28
5 calibration_2026-01-29.csv 2026-01-29
6 calibration_2026-01-30.csv 2026-01-30
```

3. Clean 2026 Calibration Data

This is the cleaning function used in the primary 2026 analysis.

Apply the cleaning function:

4. Keep Anchors Common Across 2026 Files

An anchor is retained if it appears in at least 80% of the available calibration files.

```
[1] 900
```

5. Build the 2026 Longitudinal Dataset

Only anchors with complete observations across all retained calibration dates are used in the final comparison.

Importantly, the actual calendar dates are retained rather than replacing them with sequential day numbers.

Combine the daily datasets:

Keep only anchors with complete observations:

Convert to long format:

Calculate calendar days from the first calibration date:

Check the resulting 2026 dataset:

```
  first_date  last_date calendar_days calibration_days anchors
1 2026-01-23 2026-04-14            81               80     444
```

6. Calculate Drift

The following calculation is intentionally equivalent to Zach's original 2024 analysis.

For each anchor:

$$[drift_t = \frac{|calibration_t - calibration_0|}{calibration_0}]$$

And for 2026:

7. Dataset Summary

Before comparing the plots, check the size and temporal coverage of each dataset.

```
# A tibble: 2 x 6
  year  anchors observations first_date last_date  calendar_days

```

Find the IDs that enter this range at least once

This may be closer to what you're asking: which anchors are responsible for the region between the 90th and 99.9th percentile at any point during the study?

```
# A tibble: 676 x 1

```

Find the IDs that are consistently in that range

This is potentially more interesting scientifically.

For example, suppose you want to know:

Which anchors were between the 90th and 99.9th percentile on at least 50% of the available days?

id	days_in_range	total_days	proportion_days
6323	29	29	1.0000000

You can also identify the top 10 anchors on every day

If your real goal is to investigate the anchors contributing to the upper tail of the plot, I think this is especially useful:

```
# A tibble: 290 x 4
    days date       id    max.drift
   <int> <date>     <chr>     <dbl>
 1     0 2024-10-21 6025          0
 2     0 2024-10-21 6039          0
 3     0 2024-10-21 6042          0
 4     0 2024-10-21 6043          0
 5     0 2024-10-21 6054          0
 6     0 2024-10-21 6072          0
 7     0 2024-10-21 6082          0
 8     0 2024-10-21 6087          0
 9     0 2024-10-21 6088          0
10     0 2024-10-21 6092          0
# i 280 more rows
```

```
# A tibble: 800 x 4
    days date          id max.drift
   <int> <date>     <dbl>     <dbl>

Even better: label those anchors on the plot

If you want to visually see which anchors are producing the 90–99.9% region, we can add their IDs to the plot. I would not label every qualifying anchor, because with hundreds of observations it will become unreadable.

Instead, we could label, for example, the top 10 anchors at the final day, or the anchors that are in the 90–99.9% region for the greatest proportion of the experiment.
